Many of the neurological symptoms of triple A syndrome worsen over time. Adults may exhibit progressive neural degeneration, parkinsonism features and cognitive impairment. [1] People with triple A syndrome frequently develop a thickening of the outer layer of skin (hyperkeratosis) on the palms of their hands and the soles of their feet.

In most cases, there is no family history of it. The syndrome was first identified by Jeremy Allgrove and colleagues in 1978. The syndrome involves achalasia, Addisonianism (adrenal insufficiency of primary type), and alacrima (insufficiency of tears). Alacrima is usually the earliest manifestation.

Allgrove or triple A syndrome (AS or AAA) is a rare autosomal recessive syndrome with variable phenotype due to mutations in AAAS gene which encodes a protein called ALADIN. Generally, it's characterized by of adrenal insufficiency in consequence of adrenocorticotrophic hormone (ACTH) resistance, besides of achalasia, and alacrimia.
